

HOST SETUP

Installation Guide

Set up Guest Guide Builder on your computer, then optionally open it on a phone or tablet on the same Wi-Fi network.

START HERE

This guide is for the host who purchased the product. It explains how to extract, start and access the builder — it is not the guest guide visitors scan.

1. Before you start

You need a Windows, macOS or Linux computer and Python 3. For phone or tablet access, the device and computer must use the same Wi-Fi network.

KEEP TOGETHER

Extract the full ZIP into one folder. Do not move only **index.html**; the app needs its assets and start files in the same folder.

2. Windows installation

1. Extract the ZIP to a folder.
2. Open that folder and double-click **start.bat**.
3. Your browser opens Guest Guide Builder at **<http://localhost:8080/>**.
4. Keep the start window open while you work.

WINDOWS FIREWALL

If Windows asks for permission, allow access on Private networks. This enables optional phone/tablet access on your home or property Wi-Fi.

3. macOS and Linux

macOS

1. Extract the ZIP.
2. Double-click **Start Guest Guide Builder.command**.
3. If macOS blocks it, right-click the file, choose **Open**, then choose **Open** again.

Linux

1. Extract the ZIP.
2. In a terminal in that folder, run **chmod +x start.sh**.
3. Run **./start.sh**.

PYTHON REQUIRED

If the start file says Python is missing, install Python 3 from python.org/downloads, then run the start file again.

4. Open on phone or tablet (optional)

After starting the app on your computer:

1. Keep the computer and start window running.
2. Connect the phone/tablet to the same Wi-Fi.
3. Scan the **Phone / tablet — Same Wi-Fi** QR code in the preview panel of the builder.
4. The builder opens on your device.

5. Important distinction

FIRST LAUNCH

The first time you start the builder, you must read and accept the End-User License Agreement. Acceptance is saved on your computer and is not asked again on later launches.

TWO QR CODES

The Phone / tablet QR code is only for you, the host, to open the builder locally. The guest QR is created later in the **QR code** workflow step (Settings > Publish) after your guide is online.

6. Quick troubleshooting

Python not found

Install Python 3, then start the app again.

Phone cannot connect

Confirm both devices use the same Wi-Fi, turn off mobile data on the phone and allow the Windows firewall prompt on private networks.

No Phone / tablet QR code

Restart using start.bat, the macOS command file or start.sh. Check that network-config.json was created in the app folder.

First-launch checklist

1	ZIP extracted into one folder
2	Python 3 installed
3	Correct start file opened
4	Browser builder opens
5	Start window remains open
6	Optional phone/tablet uses same Wi-Fi
